                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    went through one round of normalization, and was constructed by Bento Soares and M. Fatima Bonaldo."
a 25 c 33 g 15 t
           double-stranded cDNA was size selected, ligated to Eco RI adapters (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of a modified pT7T3 vector (Pharmacia). Library went through one round of normalization to a Cot = 5. Library constructed by Bento Soares and M.Fatima Bonaldo."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             PS Claim 6; Column 179-180; 264pp; English.

CC The sequences given in T63713-4312 represent duplex DNA's which act CC as target regions in the method of the invention. The method for CC altering the binding characteristics of a DNA-binding protein to duplex DNA comprises contacting the duplex DNA with a small molecule which CC DNA comprises contacting the duplex DNA with a small molecule which CC DNA comprises contacting the duplex DNA with a small molecule which CC molecule is bound to the target region, it is adjacent to, but not converlapping by more than 4 bp, a binding site for a DNA-binding protein. CC The small molecule is added at a concentration effective to alter the CC binding of the DNA binding protein, pref. TFIID, to its binding site on the duplex DNA. The binding protein to its binding site. The CC compounds isolated using this method are potentially useful as CC the binding of the DNA-binding protein to its binding site. The CC compounds isolated using this method are potentially useful as CC the method is suitable for scenening large biological or chemical CC The method is suitable for screening large biological or chemical CC interaries and allows determination of sequence-specific and relative CC affinities of known DNA-binding agents for different DNA sequences. CC The design of these duplex DNA's allows a single DNA:protein interaction CC to be used for screening sequence-specific, or preferential, DNA binding CC proteins that recognise almost any possible sequence (see also T49539-CC T4).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

                                                                                                                                                                                                          The sequences given in 763713-4312 represent duplex DNA's which act CC as target regions in the method of the Invention. The method for CC altering the binding characteristics of a DNA-binding protein to duplex CDNA comprises contacting the duplex DNA with a small molecule which comprises contacting the duplex DNA with a small molecule which comprises contacting the duplex DNA with a small molecule which conclecule is bound to the target region, where, when the small coverlapping by more than 4 bp, a binding site for a DNA-binding protein. The small molecule is added at a concentration effective to alter the binding of the DNA binding protein, pref. TFIID, to its binding site on the duplex DNA. The binding protein to its binding site on the duplex DNA, The binding of the small molecule may inhibit or enhance the binding of the DNA-binding protein to its binding site. The CC compounds isolated using this method are potentially useful as CC therapeutic agents for treatment of any disease which involves a CC specific DNA sequence, e.g. cancer, or inherited genetic disorders etc. The method is suitable for screening large biological or chemical CC libraries and allows determination of sequence-specific and relative affinities of known DNA-binding agents for different DNA sequences. CC The design of these duplex DNA's allows a single DNA:protein interaction to be used for screening sequence-specific, or preferential, DNA binding contents that recomplies almost any possible sequences.

Pr Sequence attached to test sequence

Pr Claim 3; COLumns 187-188; 270pp; English.

CC Sequences X17001 to X17600 represent specifically claimed target test sequences that are used in the method of the invention of determining the CC DNA sequence preference of a DNA-binding protein to a mixture of duplex DNA test oligonucleotides, each of the test oligonucleotides (1) adding a test molecule and a DNA-binding protein to a mixture of duplex DNA test sequence adjacent to a screening sequence, where the screening sequence binds to the DNA-binding protein with a binding called the test sequence, (ii) incubating the test molecule, the mixture of duplex DNA test oligonucleotides includes several test sequences; (ii) incubating the test molecule, the mixture of duplex DNA test oligonucleotides includes several test sequences; (iii) incubating the test molecule, the mixture of duplex DNA test oligonucleotides includes several test sequences and the DNA-binding protein for a time considered that the permit binding of the test molecule, the mixture of duplex DNA; (iii) separating unbound test oligonucleotides from test coligonucleotides bound to binding protein; (iv) amplifying the unbound test oligonucleotides. (v) repeating steps (ii) to (iv); (v) isolating the amplified test oligonucleotides; and (vii) sequencing the isolated test oligonucleotides. Test sequences X17481 and X17600 correspond to promoter targets for viral genes.

The sequences given in T63713-4312 represent duplex DNA's which act as target regions in the method of the invention. The method for altering the binding characteristics of a DNA-binding protein to duplex DNA comprises contacting the duplex DNA with a small molecule which binds sequence-specifically to a target region, where, when the small molecule is bound to the target region, it is adjacent to, but not overlapping by more than 4 bp, a binding site for a DNA-binding protein. The small molecule is added at a concentration effective to alter the binding of the DNA binding protein, pref. TFIID, to its binding site on the duplex DNA. The binding of the small molecule may inhibit or enhance the binding of the DNA-binding protein to its binding site. The compounds isolated using this method are potentially useful as therapeutic agents for treatment of any disease which involves a specific DNA sequence, e.g. cancer, or inherited genetic disorders etc.
                                                                                                                                                                                                                                                                                                                                                                              26-NOV-1996.

PT Determination of DNA sequence preference of a DNA-binding molecule - PT based on inhibition of binding of protein to oligonucleotide PT sequence attached to test sequence PS Claim 3; Columns 185-186; 270p; English.

CC Sequences X17001 to X17600 represent specifically claimed target test CC sequences X17001 to X17600 represent specifically claimed target test CC plays sequence preference of a DNA-binding molecule. The method comprises: CC (1) adding a test molecule and a DNA-binding protein to a mixture of CC duplex DNA test oligonucleotides, each of the test oligonucleotides can be comprised to a screening sequence binds to the DNA-binding protein with a binding CC and where the mixture of duplex DNA test oligonucleotides includes can deviate the mixture of duplex DNA test oligonucleotides includes can deviate the mixture of duplex DNA test oligonucleotides and the DNA-binding protein for a time complex DNA; (11) separating unbound test oligonucleotides from test oligonucleotides and the DNA-binding protein for a time confidence of the sequence of the sequences in class oligonucleotides; (v) repeating steps (ii) to (iv); (vi) isolating the sequence oligonucleotides; (v) repeating steps (ii) to (iv); (vi) isolating the analytical test oligonucleotides; (v) repeating steps (ii) to (iv); (vi) isolating contest oligonucleotides; (v) repeating steps (ii) to (iv); (vi) isolating the solated contest oligonucleotides. Test sequences x17481 and x17500 correspond to promoter targets for vital genes.

The design of these duplex DNA's allows a single DNA:protein interaction to be used for screening sequence-specific, or preferential, DNA binding proteins that recognise almost any possible sequence (see also T49539-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            06-MAY-1999 (first entry)
Test sequence from human histone H2a gene.

PS Claim 28; Page 296; 587pp; English.

CC A DNA protein-binding assay is provided, useful for screening

CC libraries of synthetic or biological cpds. for their ability

CC number of test sequences. The assay is versatile in that any

CC number of test sequences can be tested by placing the test sequence

CC adjacent to a defined protein-binding screening sequence. Binding

CC of mols. to these test sequences changes the binding characteristics

CC of the protein mol. to its cognate binding sequence. When such a mol.

CC of the protein mol. to its cognate binding sequence. When such a mol.

CC of the protein mol. to its cognate binding sequence. When such a mol.

CC on application of this method is to eucaryotic general transcription

CC factors (e.g. TFIID), where the target region is typically selected

CC transcription factor. Numerous exemplary test sequences are given:

CC the sequences in 069251-731 and 069850 correspond to promoter targets

CC (typically, TATA box-conty, sites) for human genes and the sequences in

CC sequences may also be randomly generated. DNA:protein interaction may

CC origin of replication and UL9 (see 069851-52, 069865 and 069891).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The sequences given in T63713-4312 represent duplex DNA's which act CC as target regions in the method of the invention. The method for CC altering the binding characteristics of a DNA-binding protein to duplex CC DNA comprises contacting the duplex DNA with a small molecule which binds sequence-specifically to a target region, where, when the small conclude is bound to the target region, where, when the small coverlapping by more than 4 bp, a binding site for a DNA-binding protein. The small molecule is added at a concentration effective to alter the binding of the DNA binding protein, pref. TFIID, to its binding site on the duplex DNA. The binding protein to its binding site on the duplex DNA. The binding protein to its binding site. The compounds isolated using this method are potentially useful as compounds isolated using this method are potentially useful as compounds isolated using this method are potentially useful as compounds isolated using this method are potentially useful as compounds isolated using this method are potentially useful as compounds isolated using this method are potentially useful as compounds isolated using this method are potentially useful as compounds isolated using this method are potentially useful as compounds isolated using this method are potential involves a compound of the sequence, e.g. cancer, or inherited genetic disorders etc. The method is suitable for screening large biological or chemical continues and malanged for screening large biological or chemical continues of known DNA-binding agents for different DNA sequences.

CC therefore the binding sequence-specific and relative affinities of known DNA-binding agents for different DNA sequences.
Determination of DNA sequence preference of a DNA-binding molecule of abased on inhibition of binding of protein to oligonucleotide sequence attached to test sequence? Sequence attached to test sequence sequences x17001 to x17600 represent specifically claimed target test sequences x17001 to x17600 represent specifically claimed target test sequences x17001 to x17600 represent specifically claimed target test sequences that are used in the method of the invention of determining the DNA sequence preference of a DNA-binding molecule. The method comprises:

(1) adding a test molecule and a DNA-binding protein to a mixture of duplex DNA test oligonucleotides, each of the test oligonucleotides having a test sequence adjacent to a screening sequence, where the screening sequence binds to the DNA-binding protein with a binding affinity that is independent of the DNA-binding protein with a binding and where the mixture of duplex DNA test oligonucleotides includes several test sequences; (11) incubating the test molecule, the mixture of duplex DNA test oligonucleotides includes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  sufficient to permit binding of the test molecule to test sequences in the duplex DNA; (iii) separating unbound test oligonucleotides from test oligonucleotides bound to binding protein; (iv) amplifying the unbound test oligonucleotides; (v) repeating steps (ii) to (iv); (vi) isolating the amplified test oligonucleotides; and (vii) sequencing the isolated test oligonucleotides. Test sequences x17001-x17481 and x17600 correspond to promoter targets for human genes and test sequences x17482-x17599 correspond to promoter targets for rural genes.

                                                                                                                                      Detecting proliferating cells in tissue or cell samples - by probes specific for histone manh for probes specific for histone manh for the sequences given in 062216-18 are probes which are specific for histone H3 mRNA. These probes may be used in the method of the invention for detecting the presence of proliferating cells in a invention for detecting the presence of proliferating the tissue/cell sample. The method comprises preparing the tissue/cell cample, hybridising these non-radioactively labelled probes, and detecting the presence of histone-probe hybrids. The method can be used to identify cells undergoing proliferation in normal and diseased tissue. It can be used in the diagnosis of cancers and in assessing the carcinogenic properties of a chemical.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          problem specific for histone many habelled oligonucleotide problem specific for histone many.
